

The whole paper in seven numbers

What the tissue does to the reading	482 pm	measured, 34 tissue draws
What full cadmium coverage would do	1446 pm	measured on tissue x assumed chemistry
Signal divided by noise, one antenna	2.98x	needs 3x, so one antenna fails
Antennas needed, spaced 15 um apart	17	a 60 x 60 um patch
Detection limit at that array	22 nM	free cadmium, at the assumed affinity
How deep the antenna senses	12-21 nm	range, not a single value
Chemistry assumption, worst case	-1092/+1606 pm	the largest uncertainty in the paper

■ measured

■ measured x assumption
